

Model AP Liner Runner Tool

The Model AP Running and Setting Tool is used to set most liner hanger packers. The right-hand-releasing running nut is used to attach the liner assembly to the running string. The Model AP running tool features a floating and spring-loaded running nut on a full bearing to ensure easy release. It also incorporates spring-loaded dogs that will kick out allowing a compression force when needed to set compression style hangers after the running nut is released. The running tool has a lower connection, allowing an inner string circulation system if needed for slotted liner and wire-wrapped screens.

Features and Benefits

- Spring-loaded running nut
- Compression force dogs
- Heavy-duty bearings
- Available for in multiple sizes
- Rotational release
- Inner-string capable
- Variety of running nuts for every application
